The upper limbs' translational kinetic energy progressively increases for the majority of the push phase such that the arms possess around 22% of the total body kinetic energy before decreasing during the late part of the pushing phase, whereas the kinetic energy of the lower limbs and trunk continue to increase until block exit.

Terrific short myth-busting interview with a running, shoe and biomechanics expert — who is (delightfully) a bit cranky about “so many wrong ideas out there.” It's all too rare to see this kind of sanity-inducing, hype-reducing talk on this topic. From the article, regarding the position of biomechanics expert Benno Nigg:

At the joint surfaces in our limbs, our bones are covered with a slick material called cartilage. Arthritis at the Base of the Thumb (a.k.a. 1st Carpometacarpal Arthritis, Basilar Thumb Arthritis) results from cartilage wear in a joint between a hand bone called the First Metacarpal and a wrist bone called the Trapezium.

The human leg, in the general word sense, is the entire lower limb of the human body, including the foot, thigh and even the hip or gluteal region. However, the definition in human anatomy refers only to the section of the lower limb extending from the knee to the ankle, also known as the crus or, especially in non-technical use, the shank. Legs are used for standing, and all forms of ...

Prosthetists provide artificial limbs and gait analysis to people who have part or all of a limb missing. Orthotists provide braces and splints to support, correct, or aid the function of people with various conditions of the neuro, muscular and skeletal systems. On this course you will learn how to assess and treat people requiring prosthetic and orthotic care.
